

HOW CELIAC DISEASE IS RATED

Current DC 7355 measures malabsorption, nutritional deficiency, systemic effects, and wasting.

CURRENT RATING LADDER

38 CFR 4.114

80%

Wasting and systemic effects

Malabsorption with activity-limiting weakness, weight loss causing wasting and deficiencies, systemic manifestations, anemia, and specified abdominal pain and diarrhea.

50%

Deficiencies and systemic effects

Chronic diarrhea managed by a medically prescribed diet, with nutritional deficiencies and systemic manifestations or villous atrophy on biopsy.

30%

Diet-managed chronic diarrhea

Chronic diarrhea managed by a medically prescribed diet, without nutritional deficiencies.

Diagnosis must be confirmed by an appropriate serum antibody test or endoscopy with biopsy. Compare DC 7328 when malabsorption is the predominant disability.
